EASY MANAGEMENT

The MicCom commander is a handheld device used to remotely control the Q5X series of audio transmitters and is essential to controlling your Q5X transmitters and their entire scope of features.

The buttons have been left off the transmitters in favor of safety and water resistance. The MicCom commander allows the user to view, monitor and adjust any Q5X transmitter at a range of over 150 ft (45 m).

As a single stand-alone unit the MicCom commander can communicate one-to-one with up to 32 transmitters, or it can group transmitters and control multiple units simultaneously, allowing access to all necessary settings for a group through a simple interface.

The transmitter power state, ON or standby, the RF power, UHF frequency, microphone muting, mic gain, groups and other operational parameters are remotely configured using the MicCom commander without physical access to the transmitter.

USB connectivity allows the MicCom commander to be connected to a laptop or PC running Windows 7 and above.

This connection allows the use of the MicControl software to control enhanced features of the transmitters including the ability to name transmitters. Naming transmitters makes it much easier to manage the system. For example; Instead of looking at a list of serial numbers e.g. 10223 or 20567 you can name them Actor 1 or Joes Mic for easier identification.
